Introduction

You can launch a new career in web development today by learning HTML & CSS. You don't need a computer science degree or expensive software. All you need is a computer, a bit of time, a lot of determination, and a teacher you trust. Once the form data has been validated on the client-side, it is okay to submit the form. And, since we covered validation in the previous article, we're ready to submit! This article looks at what happens when a user submits a form – where does the data go, and how do we handle it when it gets there? We also look at some of the security concerns.
